No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues. 

Example 6; Page 77; 157pp; English.

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bloavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer complyinging a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the protein used in the conjugate may be a wild-type or mutant sonic hedgehog protein used in the conjugate may be a wild-type or mutant sonic hedgehog protein used in the conjugate may be a wild-type or mutant sonic hedgehog (Shh), Indian hedgehog (Ihh) or Desert hedgehog (Dhh) protein. The hedgehog (Ihh) or Desert hedgehog (Dhh) protein, or may be a hedgehog fusion protein. The invention also relates to methods of a federal mapping functionally important regions of a protein by modifying accessible amino acid side chains, and determining the effect the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of protein. The hedgehog polymer conjugates may be used in the management of uniquence and autoimmum diseases, and cancers. In particular, they may be used to prevent preventing or ameliorate neurodegenerative of disorders (e.g., Parkinson's disease, Huntington's disease, Alzheimer's disease); age-associated neurodogical disease, neurological injury and trauma; immunological diseases of the nervous system (e.g., multiple selent in increased half-life, altered tissue distribution (such as may result in increased half-life, altered tissue distribution

an improved ability to stay in the vasculature for longer periods of time), increased stability in solution, protection from protectory degradation, or reduced immunogenicity. In particular, the ability to remain in the vasculature for prolonged periods may allow a hedgehog protein of the invention to cross the blood-brain barrier, and an increased thermal stability would be an advantage when formulating the hedgehog protein in powder form. The present sequence represents a human sould be an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues.

Example 2; Page 67; 157pp; English.

The invention relates to novel polymer conjugates of hedgehog proteins which have increased bicavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer comprising a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the N-terminus, or to lysine residues of the hedgehog protein. The hedgehog protein used in the conjugate may be a wild-type or mutant Sonic hedgehog (Shh), Indian hedgehog (Shh) or Desert hedgehog (Dhh) protein, or may be a hedgehog fusion protein. The invention also relates to methods of defining and mapping functionally important regions of a protein by

modifying accessible amino acid side chains, and determining the effect
the position and/or type of modification have on the activity of the
protein. The hedgehog polymer conjugates may be used in the management of
various medical conditions including various neurological disorders,
inflammatory and autoimmune diseases, and cancers. In particular, they
any be used to prevent preventing or ameliorate neurodegenerative
cd isorders (e.g., Parkinson's disease, Huntington's disease, Alzheimer's
disease); age-associated neurological disease, neurological injury and
traums; immunological diseases of the nervous system (e.g., multiple
cd disease); seroke; and malignant gliomas, medulloblastomas and
cc neuroectodermal tumours. The modifications made to the hedgehog protein
cc neuroectodermal tumours. The modifications made to the hedgehog protein
cc nimproved ability to stay in the vasculature for longer periods of
c time), increased stability in solution, protection from proteolytic
cdegradation, or reduced immunogenicity. In particular, the ability to
cermain in the vasculature for prolonged periods may allow a hedgehog
cc protein of the invention to cross the blood-brain barrier, and an
cincreased thermal stability would be an advantage when formulating the
chedgehog protein in powder form. The present sequence represents a human
cc increased mutagenic primer used in an exemplification of the

The sequences given in AAQ91654-57 are primers which were used to amplify a sequence which encodes a human sonic hedgehog protein, homologous to a brosophila hedgehog protein (AAR77337). The human sequence was isolated by screening of human genome DNA by nested polymerase chain reaction using these primers, followed by use of a clone to screen a human fetal lung 5'-stretch plus cDNA library in phage lambda-gtl0. A clone has been isolated from a phage Pl library in phage lambda-gtl0. A clone has been primers SHHF (AAQ91654) and SHHF (AAQ91655), to give clone SHHP1. A 2.5-kb ECORI CA repeat fragment is amplified using primers SHHCAR (AAQ91666) and SHHCAR (AAQ91667). Probes and primers derived from the sonic hedgehog sequence may be used as diagnostic agents for neuromuscular, autonomic or central nervous system disorders, and the gene may also be used in gene therapy. A puripodies generated from the encoded protein may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sonic hedgehog; SHH gene; HH gene; tumorigeneais; oncogeneais; basal cell carcinoma; breast cancer; medulloblastoma; tumour; cell proliferation; cell differentiation; diagnosis; therapy; human; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in paritudiar neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention

This human sonic hedgehog (SHH) gene exon 2-specific primer was used with another exon 2-specific primer (see AAV18406) in a PCR using DNA from Muman bacterial artificial chromosome (BAC) DNA pools. Only pools comprising a BAC that contains the sequence tag defined by the primer pair will yield an amplification product. The process was continued until as ingle positive BAC was identified. The positive clone, BAC270A17, was dispessed with restriction enzymes and ligated into vectorette linkers. Mutations (see AAV18403 and AAV18404) have been identified in the SHH gene in human cancers. The mutated SHH genes and the encoded polypeptides (see AAW48735 and AAW48736) can be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or
                                                                                                                                                                                                                                                    New nucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation.

The present invention relates to assay for screening compounds that corporate or inhibit binding of hedgehog polypeptide to naturally concentring patched receptor. The hedgehog proteins comprise morphogenic signals produced by embryonic patcarning centres, and are involved in the formation and maintenance of ordered spatial arrangements of differentiated tissues in vertebrates, both adult and embryonic. The proteins can be used to generate and/or maintain a array of different vertebrate tissues both in vitro and in vivo. The invention also relates to ammanian cell (e.g. neuron, testicular cell) responsive to hedgehog induction. Hedgehog agonists and anicanance of neurons and various vertebrate organogenic pathways. The hedgehog gene is useful in cell culture techniques to enhance survival and maintenance of neurons and various vertebrate organogenic pathways. The hedgehog gene is useful in determining whether a patient is at the risk of disorder characterised by unwanted cell proliferation or aberrant control of differentiation. The ceptage proteins can be used to induce foctal neurons especially neuronal stem cells in intracerebral grafting. The protein or its mimetic can be used in the treatment of neurological conditions e.g. cinjury to nervous system, isochaemia resulting from stroke, Alzheimer's condisease, Parkinson's disease, Hunthington's chorea, amyotrophic lateral conditions 
                                                                                                                                                                                                                   Screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor, comprises contacting polypeptide with receptor and test compound, and detecting change in

                                                                                                                                                             The invention relates to nucleic acids encoding hedgehog proteins selected from sonic hedgehog (Shh), indian hedgehog (Ihh), desert hedgehog (Dh) polypeptides. The hedgehog genes are involved in the formation of ordered spatial arrangements of differentiated tissue in vertebrates. The nucleic acid sequences are useful for producing hedgehog proteins, used for promoting differentiation of, or survival of differentiation on unronal calls, and for promoting proliferation, survival or differentiation of mesenchymal, endodermal or ectodermal tissue, particularly chondrocytes, or testicular germ line cells. Sequences AAH76132-133 represent PCR primers for amplifying a human Shh DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hedgehog related-protein, sonic hedgehog protein, Shh, ischemia, stroke, desert hedgehog protein, Dhh, indian hedgehog protein; Ihh, neuron, neurological condition, nervous system injury, tumour-induced injury, aging, Alzheimer, s disease; chronic neurodegenerative disease; Parkinson's disease; thronic neurodegenerative disease; spinocerebellar degeneration, chronic immunological disease;
                                                                                              Novel nucleic acid encoding a hedgehog polypeptide, used to produce the polypeptide, which is used to promote proliferation, survival, and/or differentiation of neuronal and mesodermal tissue.

PCR primers AAC87097-98 were used to amplify cDNA encoding a hedgehog related-protein. The specification describes a sonic hedgehog protein (ShN), a desernt hedgehog protein (DhN), and an indian hedgehog protein (IN)). The hedgehog polynucleotides are useful in diagnostic, in antisense therapy and in therapeutic assays for detecting and treating disorders involving, e.g., aberrant expression of vertebrate hedgehog compared in the polynetides are useful therapeutically to enhance conditions deriving from acute, subacute, or chronic injury to the conditions deriving from acute, subacute, or chronic injury, to the conditions system, including traumatic injury, chemical injury, vasal injury and deficits (such as the ischemia resulting from stroke), together with infectious/inflammatory and induced injury, aging of the nervous system including Alzheimer's disease, chronic neurodegenerative diseases of the nervous system, including Parkinson's disease, Huntington's chorea, amylotrophic lateral sclerosis, spinocerebellar degenerations, and chronic immunological diseases of the nervous system or affecting the coloresis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sonic hedgehog; Shh; desert hedgehog; Dhh; Indian hedgehog; Ihh; antiparkinsonian; antiarrhythmic; neuroprotective; anticonvulsant; extostatic; noctropic; spermatogenesis; peripheral nervous system; central nervous system; Alzheimer's disease; Parkinson's disease; Huntington's disease; arrhythmia; nerve degeneration; multiple sclerosis; immunological disorder; neoplastic; hyperplastic; PCR primer; ss.
   for treating diseases
Polynucleotides encoding hedgehog proteins, useful for treating diseases of nervous system such as Alzheimer's disease, Parkinson's disease, Huntington's chorea, amylotrophic lateral sclerosis, multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

New vertebrate hedgehog-related proteins, useful e.g. for promoting differentiation, survival and proliferation of cells, e.g. for treating neurodegeneration.

Example 5; Col 88; 116pp; English.

The present invention describes an isolated and/or recombinant comprising a hedgehog (hh) amino acid (aa) sequence concoded by a nucleic acid (il) that hybridizes under stringent conditions to lof 6 sequences (see ABN87544, and ABN87546 to ABN87550). (I) binds to a natural patched receptor. Specifically claimed example of (I) are cyprentially and ABN87545 to ABN87550). (I) binds to a natural patched receptor. Specifically claimed example of (I) are cyprentially concorpic, neuroprotective, anticonvulsant, antiarrhythmic and cytostatic activities. (I) induces the expression of the BMP-2 and 4 genes, and of the How gene. (I) and be used: (i) to promite differentiation of courconal cells and survival of the Gifferentiation of comminergic or motor neurons, proliferation of chondrocytes, and compaminergic or motor neurons, proliferation of chondrocytes, and concorpinate of alteration and/or survival of meadcemal or cetcodermal cells, either in cell cultures (particularly for preparation of transplants) or therapeutically; (ii) for detecting loss of response, in tissues or, to hh proteins; (iii) in drug screening (to identify (aut) agonists, useful e.g. for inhibition of spermatogenesis), and (iv) corticat e.g. injuries/defects in the central or peripheral nervous system, e.g. multiple sclerosis, neoplastic and hyperplastic con arrhythmias caused by nerve degeneration; immunological disorders of the nervations in the central nervous system, also to promote attachment of prostheses. The present sequence represents a PCR primer for human sonic confirmation in the central nervous system, also to promote attachment of invention in the exemplification of the present

Modulating growth, differentiation or survival of a cell, useful for treating a degenerative disorder of the nervous system characterized by neuronal cell death, comprises contacting the cell with a hedgehog polypeptide.

Example 5; Page 48; 121pp; English.

The invention relates to a method for modulating growth, differentiation or survival of a cell, comprising contacting the cell with a hedgehog or survival of a cell, comprising contacting the cell to differentiate to a neuronal cell phenotype comprising contacting the cell to differentiate to a neuronal cell phenotype comprising contacting the cell with a hedgehog polypeptide, modulating skeletogenesis by contacting a target tissue and treating a degenerative disorder of the nervous system characterised by neuronal cell death, comprising calministering a hedgehog polypeptide causing prolonged survival of neural cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptides are useful for treating a degenerative disorder of cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptides are useful for treating a degenerative disorder of neuromuscular, autonomic or central nervous system disorders of neuromiscular, autonomic or central nervous system disorders of neuromal degeneration associated with a natural aging process. The specifically Alzheimer's disease, Muntington's disease, motorophic selerosis, neuronal damage resulting from anoxia, ischaemia or trauma and neuronal degeneration associated with a natural aging process. The collisorders including disorders affecting peripheral nervous system disorders including disorders affecting peripheral nervous system disorders including disorders affecting neuronal cardiac arrhythmias which may arise from a degenerative condition whereby the nerves innervate the striated muscle of the heart, in nerve prostheses for repairing central and peripheral nerve damage, for treating neoplastic or hyperplassic corpusions and in controlling the development of stem cells created promations and in controlling the development of stem cells created promation of the disease of teme cells created promation of the disease of teme cells created by the development of stem cells created by the perver and peripheral nerves s

                                                                                                                                                                                                                                                                                              The invention relates to an isolated antibody (I) which is immunoreactive with a hedgehog polypeptide (II) that binds to a patched receptor, where (II) is encoded by uncleic acid which hybridise to a fully defined vertebrate hedgehog (hh) protein. (I) is useful as a hedgehog antagonist by blocking action of naturally occurring hedgehog protein, and therefore for inhibiting spermatogenesis. (I) is also useful for inhibiting normal ovarian function. (I) is useful for blocking the action of one or more hedgehog proteins and allows the study of the role of these proteins e.g., embryogenesis and/or maintenance of differential tissue. (I) is also useful in immunohistochemical staining of tissue samples in order to evaluate the abundance and pattern of expression of the hedgehog protein abundance and pattern of expression of the hedgehog protein to detect and evaluate hedgehog protein levels as a part of clinical testing procedure. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to a novel method for modulating growth, differentiation or survival of a cell. The method involves contacting the cell with a hedgehog polypeptide such as Desert hedgehog (Dhh), Sonic hedgehog (shh). The method is used to his sonic cell to differentiate to a neuronal cell phenotype. It is used to induce a modulate skeletogenesis. The method is used to treat a degenerative disorders of the nervous system such as neuronuscular, autonomic or central nervous system such as neuronuscular, autonomic or disease, amyotrophic lateral sclerosis, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, Wintington's disease, multiple sclerosis, Wintington's disease, and neuronal damage resulting from trauma and neuronal damage resulting from soxia-ischemata. The invention is also used for antisense gene therapy. The present sequence is human Shh DNA amplifying PCR primer. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hedgehog polypeptide; tissue array generation; tissue array maintainance; hedgehog; human; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                           Modulating cell growth, differentiation or survival, for treating
neurodegenerative diseases, such as Alzheimer's or Parkinson's disease,
comprises contacting the cell with a hedgehog polypeptide.

New nucleic acid encoding a hedgehog polypeptide having an amino acid sequence identical or homologous to a vertebrate hedgehog protein, useful for generating or maintaining an array of different vertebrate tissue in vitro and in vivo.

Example 5; SEQ ID NO 43; 118pp; English.

The invention describes an isolated nucleic acid encoding a hedgehog polypeptide having an amino acid sequence identical or homologous to a vertebrate hedgehog protein or its portion and not identical to a fully defined 471-bp sequence. The nucleic acid is useful for generating and/or maintaining an array of different vertebrate tissue both in vitro and in vivo. This sequence represents a primer used to isolate DNA encoding vivo. This sequence mundant sonic hedgehog.

New nucleic acid encoding oncogenic human hedgehog protein - usefu e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation.

Example; Page 23; 47pp; English.

used with This human sonic hedgehog (SHH) gene exon 2-specific primer was used vanother exon 2-specific primer (see AAV18406) in a PCR using DNA from

human bacterial artificial chromosome (BAC) DNA pools. Only pools comprising a BAC that contains the sequence tag defined by the primer pair will yield an amplification product. The process was continued until a single positive BAC was identified. The positive clone, BAC270A17, was digested with restriction enzymes and ligated into vectorette linkers. Mutations (see AAV18403 and AAV18404) have been identified in the SHH (see AAM48735 and AAV18404) can be used in methods for the treatment and diagnosts of cancer and other diseases involving cell proliferation or differentiation 888888888888888

Culture method for cartilage differentiation from cells under hypoxic conditions into cartilage cells applicable in cartilage transplantation, and studying genes or proteins relating to joint diseases.

Sxample 3; Page 29; 37pp; Japanese.

The present invention describes a method for cartilage differentiation by culturing cells capable of differentiating into cartilage under hypoxic conditions. Also described: (1) a method for producing cartilage cells or cartilage by culturing the required cells under hypoxic conditions; (2) drugs containing the produced cartilage cells or cartilage. (3) a method for preventing or treating joint diseases by transplanting an effective amount of the cartilage cells or cartilage; (4) the use of the cartilage cells or cartilage; (4) the use of the cartilage cells or cartilage by using the call or cartilage differentiation or joint diseases; (5) a method for screening genes relating to cartilage (6) a method for screening promoters or inhibitors of cartilage differentiation by using promoters or inhibitors of cartilage differentiation by using any of the culture methods; (7) a method for screening preventive methods; (7) a method for screening preventive for joint diseases by using the culture

methods; (8) drugs containing the screened promoters or inhibitors of cartilage differentiation, or preventives or remedies for joint diseases; (9) a method for preventing or treating joint diseases by administering an effective dose of the promoters or inhibitors, or preventives or remedies to mammals; and (10) the use of the promoters or inhibitors, or preventives or remedies for producing drugs for joint diseases. The produced cultured cartilage cells or cartilage can be used in cartilage transplantation, studying genes or proteins relating to joint diseases and screening drugs for their treatment, including diseases of bone fracture, myeloma, osteoporosis and rheumatoid arthritis. The present sequence represents a PCR primer for Indian hedgehog, which is used in an example from the present invention

New nucleic acid encoding oncogenic human hedgehog protein - useful for, e.g. treatment and diagnosis of cancer and diseases involving cell proliferation or differentiation. Example, Page 23; 47pp; English.

This human sonic hedgehog (SHH) gene exon 2-specific primer was used with another exon 2-specific primer (see AAV18410) in a PCR amplification of genomic DNA from 34 independent basal cell carcinomas. 18 4 medulloblastomas and 6 breast carcinomas. PCR primers (see AAV18407-08 and AAV18411-12) specific for SHH exons 1 and 3 were also used. PCR and AAV1841s. 2 Mutations (see AAV18403 and AAV18404) were identified in the SHH gene from 4 human cancers. The mutated SHH genes and the encoded by Porppetides (see AAV48735 and AAV1875) can be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or differentiation AAV19410/ 110 AAV10/ AAV10/

ö cDNA derived from human epidermal keratinocytes was amplified by 3-stage nesting using sonic hedgehog (5HH) gene stage 1 primers (see AAV18413 and AAV18414).

AAV184114), stage 2 primers (see AAV18415 and AAV18416) and stage 3 primers (see AAV18415 and AAV18415). The PCR product was identified as authentic SHH, A single somatic mutation (see AAV18403) of the SHH gene was found in cancers arising from 3 different tissues in independent patients. Another mutation (see AAV18404) was identified in another cancer. The mutated SHH genes and the encoded polypoptides (see AAV48735) and AAV48736) can be used in methods for the treatment and diagnosis of cancer and other diseases involving cell proliferation or differentiation Gaps .. 0 4.5%; Score 19; DB 1; Length 19; [00.0%; Pred. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome 7422.1. MDZ4 is encoded at chromosome 6921.3-22.2. MDZ7 is encoded at chromosome 6921.3-22.2. MDZ4. MDZ4. MDZ4. MDZ2, encoded at chromosome 6923. MDZ4, MDZ4, MDZ4, MDZ3, MDZ4, MDZ1, or MDZ12. The mucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The mucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The mucleic alcids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are proteins are useful as therapeutic agents for gene therapy or as protein are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its conscious including one of 2,018,500 fully defined sequences, or its conscious disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or manlysis of genetic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family membors of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of mucleic acids further comprises a tag sequence. The array of mucleic acid further comprises a tag sequence. The array of mucleic acid further comprises a tag sequence or specific contactions of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones of for additional subclones containing segments of DNA that have been contained and previously sequenced in the microarray. Note: The sequence of ata for this patent can also be obtained in electronic format directly from them instructions of the sequence of the format directly at each are sentenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Human microarray DNA oligonucleotide SEQ ID NO 66408.

(first entry)

14-OCT-2003

```
This sense primer corresponds to nucleotides 460-479 of a cDNA clone (see AAV62396) coding for novel human Desert hedgehog protein (see AAW79596).

I was used with an antisense primer (see AAV62411) in a first-steep PCR amplification of human leukaemia plasma cell line ARH-77 (ATCC CRL-1621) cDNA in a modified PCR method of 3'RACE. 2 Subsequent PCR amplifications (see AAV62423-26) yielded a cDNA clone (see AAV6239) encoding a C-terminal fragment (see AAW79599) of the novel human Desert hedgehog protein. Nucleotide sequences (see AAV62339-5) encoding mature and The Desert hedgehog DNA, protein and a claimed monoclonal antibody can be used in to elucidate hereditary morphological abnormalities in humans to establish their treatments and diagnoses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primer, neuroectoderm cell; cell production; Parkinson's disease; early primitive ectoderm-like cell; EPL cell; cell therapy; transgenic animal; gene therapy; neuronal disease; Huntington's disease; lysosomal storage disease; multiple sclerosis; memory disorder; behavioural disorder; Alzheimer's disease; organ transplant;

This sequence represents a PCR primer for the Shh gene, used within the scope of the invention. The invention relates to a method for producing scope of the invention. The invention relates to a method for producing concrected early primitive ectoderm—like (EPL) cells and a neural-inducing conditioned primitive ectoderm—like (EPL) cells and a neural-inducing conditioned confident to a mine sufficient to generate controlled confident to a mine sufficient to generate controlled confident to a nimal cells or partially differentiated progeny are differentiation to (I). The cells or partially differentiated progeny and pendual gene thereapy, the screening of pharmaceutical that induce a biological response in neuroectoderm cells or their partially differentiated progeny and evaluation of feature cells. The method is useful for producing controlled for meural cells. The method is useful for producing controlled for maintaining neuroectoderm cells. The method can cell populations. It can also be used for producing content of neuroal diseases, including Parkinson's disease, content cells and be used for producing content of neuroal diseases, including Parkinson's disease.

Contention's disease, lysosomal storage diseases, multiple sclerosis, also be used for produced by the method are used for the treatment of spinal correction of cells produced by the method are used for the treatment of spinal corrections.
                                                                                                                                                                             Producing neuroectoderm cells for treatment of Parkinson's and Alzheimer's and for transplantation comprises culturing early primitive ectoderm-like cells in conditioned medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

MDZ3, New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 1907; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7g22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 15g26.1. The MD23, MD24, MD21, and MD212 is encoded at chromosome 15g26.1. The MD23, MD24, MD21, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for disgnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic

probes are acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes ar useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention. 888888888

MDZ3 New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 1906; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ1, MDZ4, MDZ7, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6501.3-22.2, MDZ7 is encoded at chromosome 16011.2 and MDZ12 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 1602.2 associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ1, or MDZ12, e.g. cancer or developmental disorders. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are also be useful as therapautic genetic locus. The probes are protein are useful as therapeutic agents for gene therapy or as protein are useful as therapeutic agents for gene therapy or as protein are useful as therapeutic agents for gene therapy or as

This invention relates to a novel method for the detection, treatment and/ or prevention of cellular debilitations or derangements caused by the development of sporadic basal cell carcinoma (BCC). Specifically, it refers to the identification of relevant therapeutic agents based on their effect on the expression level and activity of the Glil transcription factor gene. Glil is a proto-oncogene that is ectopically expressed in epidermal tissue and is linked to tumour formation and neoplasia. The present invention describes cytostatic Glil inhibitors that are useful for detecting the onset or presence of sporadic BCC in an animal. Furthermore, it includes methods for testing the ability of a animal. Furthermore, it includes methods for testing the ability of a drug or other entity to modulate the activity of Glil. This oligonucleotide sequence is the RT-PCR primer Shh-D used to amplify human Shh (secreted sonic hedgehog) RNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Upstream activating sequence; transgenic animal; regulatory DNA sequence; hedgehog gene; bigenic animal; transcriptional activating sequence; disease model; cancer; altered vascularisation; brain size regulation; autoimmune disease; tissue proliferation; Parkinson's disease; Shh;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventing or treating sporadic basal cell carcinoma by administering an inhibitor of glioma transcription factor-1 (Gli1) activity or expression, and diagnosis of the disease by detecting the presence and level of expression of Gli1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a method of detecting the onset or presence of sporadic basal cell carcinoma (BCC) in an animal. The method involves measuring the level of Gili in a sample of Skin. Gili levels above basal or normal indicate the presence or onset of sporadic basal cell carcinoma. Gili is a zinc finger transcription factor down stream of secreted sonic hedgehog (shh) activation in a cascade of cytoplasmic signal transduction. Gili in turn can induce Shh expression in an autoregulatory manner. There are links between ectopic expression of the Gili gene and the development or onset of BCC. The method is useful for detecting the onset or presence of sporadic basal cell carcinoma, particularly in detecting skin cancer. The present sequence represents a PCR primer specific for human Shh cDNA. The primer is used in the method

the invention

```
This sequence represents a PCR primer for the mouse Shh gene. The invention relates to a transgenic non-human animal (A) whose cells contain a non-viral regulatory DNA sequence (I) (e.g. an upstream a cativating sequence) linked to a recombinant hedgehog gene (II), which was introduced into the mammal, or its ancestor, at an embryonic stage. Bigenic animals (A'), derived from (A) by introducing a transcriptional activating sequence (TAS), are useful as models of disease, particularly cancer (of breast, skin, protate, kidney, lung, or central nervous system, also primitive neuroectodermal tumours and medulloblastoma). CC target genes on signalling pathways involving hedgehog proteins (HP) (e.g. altered vascularisation, regulation of brain size, density and cellular concentration etc.), and for assaying for a temporal requirement of Path in disease progression (particularly of cancers and autoimmune corrector medials can be used to screen for potential therapeutic disease). The animals can be used to screen for potential therapeutic care returned to the subject, specifically for treatment of Parkinson's or proliferation and differentiation. Hedgehog proteins can also be used to expand a population of neural stem cells from a subject, then the cells come a simple cross since the transcription activate otherwise silent transgenes in progeny from a simple cross since the transcription activator and the silent transgene are maintained in separate mouse lines, and abnormal expression is only induced in the bigenic animal. This eliminates the need for microinjection and genotypic screening for each experiment, and many procession expenses or province contained for experiment, and many procession expenses or province contained for experiment, and many procession expenses or province contained for experiment and ex

                                                                                                                                                                                                                                                                                    The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine shydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholaminerlated diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MD23; MD24; MD27; MD212; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer. Example 8; SEQ ID NO 1904; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD212, MD212. MD23 is canced at chromosome 7422.1, MD24 is encoded at chromosome 7422.1, MD27 is encoded at chromosome 6921.3-222.2, MD27 is encoded at chromosome 1691.2 and MD212 is encoded at chromosome 1601.2 and MD212 is encoded at chromosome 500.1 in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as protein are useful as therapeutic agents for gene therapy or as

Use of a modulator of Hedgehog signaling pathways for treating T-cell mediated disease or infection and diseases associated with increased or decreased T-cell apoptosis and T-cell proliferation.

The invention relates to use of a modulator of a Hedgehog signalling pathway or a modulator of a target of the pathway in the preparation of a medicament for treating T-cell mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and for modulation of the Notch signalling pathway in cell apoptosis, and for modulation of the Notch signalling pathway in cimume cells. The modulation is useful for treating cancer of the breast, prostate or ovary, lymphomas and carcinomas, autoimmune diseases such as systemic lupus erythematosus, multiple sclerosis and diseases such as systemic lupus erythematosus, multiple sclerosis and diseases such as oppositions such as obtendarthitis and Crohn's diseases such as oppositions such as AlbS and herpesviruses, genetic immunodeficiencies, neurodegenerative diseases such as Alzhaimer's disease and Parkinson's disease, myelodysplastic syndromes such as aplastic anaemia, isochaemic cirrhosis and wasting diseases such as aplastic anaemia, isochaemic cirrhosis and wasting diseases such as cachexia. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in the scope of the 10; Page 110; 154pp; English.

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 114707; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more hubbidising at least one as one or more nucleic acids to at least two or more probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,

or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html

New rat connective tissue growth factor, its related gene and antisense sequences useful for modulating CTGF and treatment of cell proliferative disorders.

Example 1; Page 37; 55pp; English.

PCR primers AAA15463-64 were used to amplify DNA encoding a rat connective tissue growth factor (CTGF) polypeptide. The polypeptide may play a signaficant role in the normal development, growth and repair of mammalian tissue. Attisance sequences can be used to inhibit the expression of CTGF in a cell. In particular, the antisense sequences are useful for ameliorating cell proliferative disorders associated with CTGF, e.g. overgrowth of cells, e.g. connective tissue cells. The regulation of CTGF activity comprises down-regulation. The disorders, which can be treated, are chosen from scleroderma, arthritis, cirrhosis, hepatic fibrosis, renal fibrosis, atherosclerosis, cardiac fibrosis, adhesions and surgical scarring. The amisense sequences can also be used to detect expression of CTGF in a sample

PCR primers AAZ99759-60 were used to amplify a 558 bp of the connective tissue growth factor (CTGF) gene. The specification describes methods for treating or preventing fibrosis or a renal disorder associated with overproduction of extracellular matrix, by administering to a subject an agent that modulates, regulates, or inhibits the expression or activity of CTGF, Healthy individuals demonstrate consistently low levels of urinary CTGF, while in patients with kidney disease the mean level of CTGF increased 4-fold. In those patients with diabetes, but as yet undiagnosed kidney disease, a similar increase was seen. The methods and agents are useful for diagnosing, treating or preventing fibrosis, diabetes, hypertension or a renal disorder associated with overproduction of extracellular matrix.
                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing, treating or preventing fibrosis, diabetes or a renal disorder associated overproduction of extracellular matrix comprises administering an agent which modulates/inhibits the expression/activity of connective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Connective tissue growth factor; CTGF; fibrosis; renal disorder; extracellular matrix; kidney disease; diabetes; hypertension; FCR primer;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its compered match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, and an monitoring gene expression levels by hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for marked compounds. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring compenses are attached to a solid support. The analysis comprises monitoring compenses are attached to a solid support. The analysis comprises monitoring compenses is useful in in a situ hybridisation. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid probes in mapping the 5' termini of mRNA molecules by confidentian of any gene, in mapping the 5' termini of mRNA molecules by confident acidentify or detect the sequence or specific confidentian subclones containing segments of DNA that have been concluded and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence containing the microarray. Note: The sequence contains the microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 8430; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018 500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in bybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring compression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes in situ hybridisation, in Southern, Northern or dotonois and setting the sequence or specific confort hybridisation to identify or detect the sequence or specific confort additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence cate for additional subclones containing segments of DNA that have been solated for this patent can also be obtained in electronic format directly conforts and stream of the electronic format directly conforts and stream of the electronic format directly conforts and stream of the electronic format directly conforts and sequence.

Modified hedgehog protein, useful in the treatment of Parkinson's disease and Huntington's chorea, comprises a polymer containing a polyalkylene glycol group linked to any residue other than the N-terminal and lysine residues

Example 6; Page 77; 157pp; English.

The invention relates to novel polymer conjugates of hedgehog proteins are which have increased bioavailability. The hedgehog proteins are conjugated to a non-naturally-occurring polymer complying a polyalkylene glycol group, with the proviso that the polymer is not conjugated to the glycol group, with the proviso that the polymer is not conjugated to the glycol group, with the proviso that the polymer is not conjugated to the protein used in the conjugate may be a wild-type or mutant sonic hedgehog protein. The hedgehog (thh) or besert hedgehog (thh) protein. The hedgehog (thh) or besert hedgehog (bh) protein or may be a hedgehog fusion protein. The invention also relates to methods of a faint and or type of modification have on the activity of the conjugate may be used in the management of the position and/or type of modification have on the activity of the protein. The hedgehog polymer conjugates may be used in the management of various medical conditions including various neurological disorders.

Commany be used to prevent preventing or ameliorate neurodogenerative of disorders (e.g., Parkinson's disease, mutingon's disease, Alzheimer's disease); age-associated neurological disease; neurological injury and crauma; immunological diseases of the nervous system (e.g., multiple collesses); age-associated neurological disease; neurological injury and concertosish; stroke, and malignant gliomas, medillobiastomas and concertosish; stroke, and malignant gliomas, medillobiastomas and concertosish in increased half-life, altered tissue distribution (such as an introper or sequence of the headehog protein from proteclytic con improved ability to stay in the vasculature for longer periods of the vasculature for longer periods of the headehold muton, or reduced immunogenicity. In particular, the ability to create the headehold management of the headehold protein of the invention to cross the blood-brain barrier, and an increased thermal stability would be an advantage when formulating the hedgehog protein in powder form. The present sequence represents a human sonic hedgehog mutagenic primer used in an exemplification of the

SRF variants and/or members of the SRF signal transduction pathway in eukaryotic cells for the preparation of a therapeutic drug or a pharmaceutical composition for the preparation of a therapeutic drug or a pharmaceutical composition tumour metastasis, auto-immune diseases, disturbances of would healing, lymphocyte homing and disturbances of immune defense mechanisms that are linked with SRF- related cellular malfunctions. Pharmaceutical compositions of the invention are used in treating diseases associated with expression or misexpression of SRF target gene, which include formation of diseases like metastatic cancer which is influenced by the gene UPA-R, diseases like chronic renal failure, cancer and various hypodyycaemias. The present sequence is Shh specific reverse transcription PCR (RT-PCR) primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of active agent stimulating expression of serum response factor, its variants or components of signal transduction pathway of factor in eukaryotic cells, for treating disturbances or illness e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                          tumour invasion; tumour metastasis; auto-immune disease; would healing; lymphocyte homing; immune defense mechanism; chronic renal failure; cellular malfunction; metastatic cancer; illness; hypoglycaemia; RT-PCR; Shh; reverse transcription PCR; primer; ss.

```

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD24, MD24, MD212, MD212. MD23 is canceded at chromosome 7422.1, MD24 is encoded at chromosome 7621.1, MD24 is encoded at chromosome 6721.2, MD27 is encoded at chromosome 16011.2 and MD212 is encoded at chromosome 16011.2 and MD212 is encoded at chromosome 5921.3-22.2, MD27 is encoded at chromosome 16011.2 and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with MD21, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease acused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212, genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect missues mentiones missued.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library.

In analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acid to hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotucleic acid further comprises a tag sequence. The array of nucleic acid probes is useful in n situ hybridisation, in Southern, Northern or dotuction of any gene, in mapping the 5' termini of mRNA molecules by correct or additional subclones containing sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence adara for this patent can also be obtained in electronic format directly correctly in the microarray. Note: The sequence.

16-OCT-2003

PCR primer P24 to convert human antibody CAT-212 to IgG format

```
The present invention relates to nucleic acid sequences that are complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nuclectides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, sense mismatch, antisense match or antisense mismatch oligonucleotides. The probes may be used in a array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression nucleic acid probes. The array is useful in monitoring gene expression cariations, and in hybridisation to a DNA library, in analysing genetic variations, and in hybridisations of a gene. The probes are also useful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termini of many molecules by primer strensions. The sequence of the invention are also useful as PCR primers complementary to particular genes with a wide range of analytical uses. CMH50865-ACH65260 represent the target sequences of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipplDEDIETRY.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes.

The invention relates to a specific binding member which binds to human ectaxin. The binding member comprises an antibody variable heavy (VH) domain from CAT-212 (WH) Variable heavy (CDRs). Variable light (VI) domain from CAT-212 (WH) domain and a VH/VI complementary determining regions (CDRs). Botaxin is a chemoattractant protein that binds to a specific receptor which is expressed predominantly on eosinophils. The binding member is useful for neutralising eotaxin, which is useful in treating at ham, eczema and other atopic diseases such as rhinitis, food allergy, conjunctivitis, allergic colitis which are recognised as eosinophilmentary bowel disease which includes eosinophilic colitis/enteritis/spulman's syndrome, vasculitis including Hugues-Stovin gastroenteritis/shulman's syndrome; vasculitis including Hugues-Stovin syndrome, Churg-Starauss syndrome. The present sequence is a PCR primer used for converting encoding human antibody CAT-212 (ScFv-single chain variable region fragment) to IgG DNA (whole antibody) format
Human, eotaxin, CAT-212; antibody, heavy chain variable region, VH; eczema; asthma; atopic disease; dermatological; rhinitis; food allergy, vasotropic; conjunctivitis; allergic colitis; psoriasis; pemphigoid; eosinophil-mediated disease; cellulitis; drug eruption; vasculitis; inflammatory bowel disease; gastroenteritis; PCR primer; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human antibodies against eotaxin useful for treating asthma, eczema and other atopic diseases, comprises an antibody variable heavy or variable light domain from CAT-212 or from complementary determining regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 21 BP; 3 A; 4 C; 11 G; 3 T; 0 U; 0 Other;

primer X2R for detection of Pragile E site. <u>Б</u>

(first entry)

13-MAY-2003

Fragile E site; diagnosis; microcapillary electrophoresis; human; trinucleotide repeat; screening; PCR; primer; 88.

Homo sapiens.

WO2003014396-A1

```
The present invention relates to a method for diagnosis of a multiplication disease of repeated trinucleoride sequence. The methods multiplication disease of repeated trinucleoride sequence by PCR, analysis of the amplified product on microcapilary electrophoresis (CE), analysis of the amplified product. In Fragile E site (FRAXE), in genetic region Xq28, a CCG trinucleoride is repeated 6-25 times in describing the amplified product. In Fragile E site (FRAXE), in genetic region Xq28, a CCG trinucleoride is repeated 6-25 times in healthy subjects and over 200 times in affected individuals. The present sequence is that of reverse primer XXE which is specific to the FRAXE repeated trinucleoride sequence region. It is used with forward primer XZF (see ABZ5546) to detect FRAXE. A diagnosis kit comprising these produced. Use of CE, especially fabricated as an on-chip analysis system, allows the size of the PCR product to be measured rapidly, with accuracy and reproducibility. The method allows diagnosis before the disease develops and determination of whether a silent carrier will develop the
                                                                                                                                                                                                                                                                          Diagnosing multiplication disease of repeated trinucleotide sequences e.g. Huntington's disease, by amplifying repeated trinucleotide sequence region, migrating and separating product by microcapillary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 22 BP; 4 A; 7 C; 8 G; 3 T; 0 U; 0 Other;

The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, invenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriaals, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
(systemic) lupus erythematosus, multiple sclerosis, contact dermatitis, rhinitis, allergy, cancer and metastases. The oligonucleotides may also be used to manipulate T cell activation ex vivo; to determine or detect B7 protein expression; for diagnosis; as assay and purification reagents and to study physiological roles of B7 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The oligonucleotides which specifically hybridise to B7 modulate its expression (and thus T cell activation and proliferation). This is particularly useful for treatment and prevention of inflammation and autoimmune diseases, e.g. asthma, (juvenile) diabetes, myasthenia gravis, Grave's disease, rheumatoid arthritis, allograft rejection, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; human; B7; T cell; inflammation; autoimmune disease; cell activation;
                                                                                                                                                                                                                      The invention relates to a novel mastocyte-specific guanine trinucleotidase 17.49. The protein is useful for treating diseases such as cancer and HIV infection. The current sequence represents a primer related to the mastocyte-specific guanine trinucleotidase 17.49 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligo:nucleotide(s) that modulate expression of B7 proteins - used for, e.g. controlling activation and proliferation of T cells, particularly for treatment, diagnosis and prevention of inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Claim 3; Page 82; 109pp; English.
```

The invention relates to antisense compounds, compositions and methods for modulating the expression of calreticulin. The compositions comparise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human cells or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmune disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is an antisense compound gapmer oligonucleotides

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 8209; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions,

Novel antisense compound targeted to nucleic acid encoding calreticulin, useful for treating a human having disease or condition associated with calreticulin e.g. cancer, viral infection, autoimmune disease.

Wed Apr 41 12:58:41 2004

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second acrive agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of contining surfacturing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed or specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Murray SF, Wyatt JR;

WPI; 2003-175279/17.

New compound having a sequence targeted to a nucleic acid encoding Transforming growth factor beta-receptor II, useful for preparing a composition for treating hyperproliferative disorder e.g., lung, liver, colon or gastric cancer.

Claim 3; SEQ ID NO 147; 141pp; English.

The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence

represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II. ន្តដ្ឋនូ

Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.

Example 1; SEQ ID NO 26; 88pp; English.

The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.

```

A method has been developed for detecting T-cell activation by evaluating the amount of MUC-1 mucin expression in a T-cell compared to a non-activated control. The method is useful for treating disorders associated with T-cell activation, using an agent (artibody/antagonist) that modulates MUC-1 activity. The T-cell activation associated disorders may be autoimmune or inflammatory disorders (e.g. inflammatory arthritis, portasis, allergies, allergic contact dermatis, rhemmatoris and arthritis, psoriasis, allergies, allergic contact dermatis, ankylosing spondylitis, myasthenia gravis, systemic lupus erythematosus, poblyarteritis nodosas, Goodpastures syndrome, isopathic thrombocytopenic purpura, autoimmune haemolytic anaemia, Grave's disease, rhemmatic fever, permicious anaemia, insulin-resistant diabetes mellitus, bullous pemphigus vulgaris, viral myocarditis (Cocksakie B virus response), autoimmune thyroiditis (Hashimoto's disease), male infertility (autoimmune), sarcoidosis, allergic encephalomyelitis multiple sclerosis, Sjorgens disease, Reiter's disease, Celiac disease, cancer. The present sequence represente a PCR primer for human MUC-1, which is used in an example from the present invention

AAF92239,

The present sequence is a PCR primer for the human muc-1 mRNA. It was used to amplify the sequence in order to determine the expression pattern of the protein. This showed that MUC-1 is a fimunosuppressor, and its antagonists act to reduce overactive immune responses. Thus, MUC-1 required to treat inflammatory disorders such as rheumatoid arthritis, psoriasis, allergic contect dermatitis and ankylosing spondylitis, autoimmune disorders including myasthenia gravis, systemic lupus erythematosus, polyarteritis nodosa, Goodpastures syndrome, isopathic thrombocytopoenic purpura, autoimmune haemolytic anaemia, Graves' disease, rheumatic fever, pernicious anaemia, insulinersistant myocarditis, autoimmune thyroiditis, male infertility, sarcoidosis, viral myocarditis, autoimmune thyroiditis, male infertility, sarcoidosis, allergic encephalomyelitis, multiple sclerosis, Sjorgens disease, Caliac disease, sympathetic ophthalmia and primary biliary cirrhosis, immune disorders, graft versus host disease and Gaps Use of agent capable of intracellularly inhibiting mucin MUC-1 for inducing T-cell-based immunosuppression and for treating autoimmune disorders, transplant rejection and inflammatory disorders. autoimmune disorder; immune disorder; ö Query Match 3.7%; Score 15.8; DB 1; Length 21; Best Local Similarity 89.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides the protein and coding sequences of characteristic variants of the human immunoglobulin E receptor beta chain (IGERB). These contain single nucleotide polymorphisms (SNPB) which may be indicative of a predisposition to atopy, allergy, asthma, rhinitis and eczema. Also provided are the sequences of probes and primers for use in identifying the genotype of an individual with regards to the IGERB gene. The IGERB gene is found at human chromosome 11q13. The sequences are all useful in therapeutics. The present sequence was used to isolate
Human, immunoglobulin E receptor beta chain; IGERB; chromosome 11q13; allergy; asthma; rhinitis; eczema; single nucleotide polymorphism; SNP; atopy; probe; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene construct, genome modification, higher plant, plant, marker gene, homologous recombination, cloning site, T-DNA, plant transformation, monocotyledon, Agrobacterium, gene function analysis, PCR primer, ss.
                                                                                                                                                                                                                                                                                                                    Novel polynucleotide useful for therapeutic purposes, comprises nucleotide polymorphisms in immunoglobulin E receptor beta chain gene.

The present invention describes a gene construct (1) for modifying the genome of higher plants by homologous recombination. (1) comprises marker genes and cloning sites between the right bottom sequence (BR) and left bottom sequence (BR) and left in the first cloning sites between the right bottom sequence (BR) and left obttom sequence (BL) originating from T-DMR. Also described: (1) a vector for plant transformation containing any of the constructs, particularly with a first cloning site for integration into the 5' region in the homologous recombination of the target gene into the 3' region in the homologous recombination of the target gene into the 3' region in the homologous recombination of the target gene into the host genome, and a second cloning site for integration into the host genome; and (2) producing a genome-modified higher plant (especially a monocotyledon) by using homologous recombination through negative or calluees with the Agrobacterium; (11) infecting plant cells, tissues or calluees produced by homologous recombination through negative or positive selection; (iv) culturing selected cells or tissues into calluees; (v) culturing in callue. regenerating medium to grow into heterozygously modified plants; and (vi) producing homozygously modified plants; and (vi) producing homozygously modified plants; and (vi) producing homozygously modified plants; and the callue of the constructs are useful for modifying the genome of higher plants by homologous recombination without altering the original locus, for the analysis of genomination which is used in an example from the present invention
                                                                                                                                                                                                               A gene construct for modifying the genome of higher plants by homologous recombination without altering the original locus, comprises marker genes and cloning sites between the right and left bottom sequences from T-DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer; anti-cks1; antisense oligonucleotide; benign lesion; papilloma; atherosclerosis; psoriasis; autoimmune disease; bacterial infection; viral infection; HIV; hepatitis; herpes; polythemia; mastocytosis; cks1 inhibitor; skp2 inhibitor; cytostatic; antisense therapy; sarcoma; leukaemia; Hodgkin's lymphoma; non-Hodgkin's lymphoma; adenoma; melanoma; carcinoma; colon cancer; pancreatic cancer; cervical cancer; human; Skp2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

Treating cancer, e.g. sarcoma, leukemia, (non-)Hodgkin's lymphoma, adenomas, melanomas, carcinomas, colon cancer, pancreatic cancer or cervical cancer, by employing an anti-cks-1 antisense oligonucleotide.
                                                                                         Disclosure, Page 86, 87pp, English.

The present invention describes a method for treating cancer comprising using an anti-cksl antisense oligomucleotide. Also described: (1) treating benign lesions (e.g. papillomas, atherosclerosis and psoriasis), autoimmune diseases, bacterial infections, viral infections (e.g. HIV infections, hepatitis or herpes infections), polythemia, or mastocytosis using the cksl antisense oligomucleotide or as skp2 inhibitor; (2) treating cancer using a skp2 inhibitor; (3) cksl inhibitor; (4) a ribozyme, a protein, a polypeptide, an antibody or a small molecule; (4) in solated polymucleotide with a sequence comprising a transcriptional initiation region and a sequence encoding an antisense oligomucleotide; (5) a recombinant vector comprising the polymucleotide; and (6) inhibiting the expression of cksl or skp2 in a mammalian cell. cksl and skp2 antisense therapy, and as Cksl and Skp2 inhibitors. The method is used in antisense therapy, and as Cksl and Skp2 inhibitors. The method is used in antisense melanomas, carcoma, leukaemia, (non-lhodykin's lymphoma, adenomas, melanomas, carcinomas, colon cancer, pancreatic cancer, or cervical cancer. The persent sequence represents an antisense oligomucleotide given in the Sequence Listing of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 23 BP; 8 A; 9 C; 5 G; 1 T; 0 U; 0 Other;

늉 The present invention relates to a method for determining the presence oneoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention ####X#X00000000X8

p53-dependent apoptosis-associated protein and its encoding gene p53AIPI, used for screening apoptosis mediated remedies for cancer and as controllers of apoptosis induction. WPI; 2002-217192/27 

Example 7; Page 40; 121pp; Japanese.

The invention relates to human p53-dependent apoptosis-associated protein, P53AIPI comprising fully defined 806, 777, 2659 nucleotide sequences (ABL54631-ABL54633 respectively) given in the specification and proteins having fully defined 124, 86 and 108 amino acid sequences (ABB08837-ABB08839 respectively) given in the specification. The protein and encoded gene have cytostatic activity, are useful in screening for regulators of apoptosis for subsequent use as cancer treatments. The present sequence is that of the Human p53AIPI associated PCR primer, useful to the invention

The present invention relates to an expression library comprising synthetic or semi-synthetic nucleic acid sequences, not cloned from an immunized source, where the nucleic acid sequences are darived from mutagenised immunoglobulins that are naturally devoid of light chains. The library is useful for the preparation of antibodies having binding specificity for a target antigen which avoids the need for a donor to have been previously immunized with the target antigen. The recombination of heavy and light chains is avoided, therefore preventing the formation of molecules that are non-functional. The number of hypervariable residues in the binding domain is reduced, allowing a more complete reperior to possible binding variants to be obtained. The present sequence is a PCR primer targeted to anchor regions in llama antibodies. The primers (ApA73754 amplified the framework regions F1, and primer and the control of the primer targeted to anchor regions in llama antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heavy chain; tetanus; toxin; human; monoclonal; antibody; K4.1; hybridoma; immortalisation; in vivo; xenomice; analysis; immunglobulin; diagnosis; research; therapy; B cell; primer; polymerase chain reaction; amplification; PCR; ss.

The invention relates to modification of the half-life of an antibody.

The method of the invention comprises physically linking an antibody.

The method of the invention comprises physically linking an antibody which contains an Pern receptor binding molety (linge, CR2 and CR3)

domains) to a second Form binding molety, (linge, CR2 and CR3)

CC molecules are protected from degradation by the endosomal FcRb/FcRn

CC receptors, which gives them a relatively extended serum half-life

relative to other serum proteins. The presence of a second FcRn binding

CC moiety further extends the serum half-life of an antibody. By increasing

CC moiety further extends the serum half-life of an antibody by increasing

CC clinical treatments is lowered. This could significantly lower costs for

CC treatment, and lead to less frequent hospital visits as fewer doses are

CC required, thereby increasing the quality of life for patients, and

CC potentially reducing the likelihood of toxicity. The technology can also

CC be adapted to extend the serum half life of other proteins, in addition

CC contibudies. Sequences AAAG6862-A66863 represent PCR primers used in an exemplification of the present invention to amplify CDNA generated from

CN bunan monoclonal antibody poly(A+) mRNA expressed in XenoNice. The PCR

CN products were then cloned into pCRII and sequenced
                                                                                   Modifying antibody half life by linking the antibody to an FcRn binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytotoxic T-lymphocyte antigen-4; CTLA-4; antibody; immune system; hyperimmunity disorder; autoimmune disease; diabetes; graft rejection; proliferative disorder; cancer; immunodeficient disorder; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a primer for the PCR amplification of the CDNA encoding the heavy chain of the anti-teranus toxin (TT) human monoclonal antibody (MAD) K4:1, which was secreted by the hybridoma K4:1 and obtained by immortalising B cells from xenomice (containing integrated human DNA from the immunoglobulin locus) immunised with TT. The MAD can be used for analysis, diagnosis, research and therapy, particularly for human therapeutic, and in vivo diagnostic applications

The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates belowing 10040. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibodiezerial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or
                                       The invention relates to an antibody that binds to an epidermal growth factor receptor (FGF-r) and exhibits inhibition of Expropriation of EXF-r), the degradation of EXF-r, the EXF induced degradation of EXF-r, vascular endothelial cell growth factor (VEGF) production by tumour cells (by greater than 50%) and endothelial cells of by greater than 40%) and also protects threonine phosphorylation of EXF-r and a 63XD protein. The antibody is inhernalised with EXF-r. The antibody may be used for treating tumours such as lung tumours and colon tumours and for treating inflammation and autoimmune diseases. This sequence represents a PCR primer used to amplify cDNA molecules encoding human EXF-r receptor antibodies of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    anti-CD40 monoclonal antibody, CD40; cytostatic; virucide; antibacterial; immunostimulant; anti-HIV; hyperproliferative; cancer; viral; bacterial infection; immunodeficiency; neutropenia; HIV; gene therapy; human; PCR; primer; ss; universal; VH; MG-30.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; epidermal growth factor receptor; EGF-r; primer; ss; cytostatic; antiinflammatory; immunosuppressive; tyrosine phosphorylation; EGF-2; eggr-radetion; vascular endothelial cell growth factor; VEGF; tumour; endothelial cell; threonine phosphorylation; autoimmune disease; colon; inflammation; lung; cancer; PCR.
                                                                                                                                                                                                                                        The present sequence represents a PCR primer which is used to amplify a fragment of the gene encoding a heavy chain of human antibodies against cytotoxic T-lymphocyte antigen (CTAA)-4. The specification describes an synthetic antibody which is capable of binding CTAA-4. The antibody is composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FRS sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTAA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTAA-4 stimulatory agents may be used to upregulate immune system to up-regulate immunodeficient disorders
                                                                                              Novel antibodies capable of binding cytotoxic T-lymphocyte antigen (CTLA) -4 containing specified heavy and light chain sequences, useful for treating, e.g. immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sully human monoclonal antibodies that bind to epidermal growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human epidermal growth factor receptor (EGF-r) antibody PCR primer #1.

missing 5' sequence of CDNA encoding a novel canalicular multispecific organic anion transporter (CMOAT) protein, isolated from a human lambda gtil liver cDNA library. The protein is a new member of the ATP-binding cassette (ABC) transporter family. The ATP dependent cMOAT transporter system mediates hepatobilizry excretion in the liver. cMOAT may be a liver-specific homologue of multidrug resistance-associated protein. The nucleic acids are used to provide cells with cMOAT protein activity.

CMOAT protein activity in cells can be enhanced by increasing the level of glutathione, glucuronide and/or sulphate. Antisense constructs, especially derived from another multidrug resistance (WDN) -related protein, e.g. MDR-1, to the nucleic acids and vectors can be used to decrease the level of cMOAT in a cell. The nucleic acids and proteins can be used especially in diagnosis of Dubin-Johnson disease, Rotor disease or another disease involving cMOAT. The cMOAT gene may also be used as a selectable marker gene. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                        Canalicular multispecific organic anion transporter protein, rown ATP-binding casette transporter family; ABC transporter, hepatobiliary excretion; multidrug resistance-associated protein, cMOAT protein activity; multidrug resistance-related protein; Dubin-Johnson disease; Rotor disease; PCR primer; ss.
                                                                                                                     used to isolate the missing 5' sequence of rat CMOAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding human and rat canalicular multispecific organic transporter proteins - useful for diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 15; DB 1; Length 23;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The calpain large subunit 1 gene located on chromosome 15 codes for a calcium activated neutral protease (CANP3) belonging to the calpain family. Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragments of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to CAMD2 disease. Bight primers (AAT32456-63) were used to localise the calpain large subunit 1 gene. The results positioned the gene in a region previously defined as 15q15.1-q21.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human novel Calpain large sub:unit 1 gene encoding a calcium dependent protease - used to develop prods. for the diagnosis and treatment of limb -girdle muscular dystrophy 2 disease.
therapy procedures. The current sequence is that of the human anti-CD40 antibody-related PCR primer of the invention.

Use of benzoxazinone derivatives for treating a subject suffering from a disorder in glucose and lipid metabolism such as non-insulin dependant diabetes mellitus or obesity.

Example 2; Page 34; 45pp; English.

The invention relates to benzoxazinone derivatives useful as peroxisome proliferator activated receptor (PPAR) gamma modulators. The invention desorbates to pharmaceutical compositions comprising benzoxazinone derivatives and methods for treating the onset of a disorder in glucose and lipid metabolism, preferably a condition of reduced insulin sensitivity such as non-insulin dependant diabetes mellitus (NIDDM), polycystic ovary syndrome (PCOS), hypertension, ischaemia, stroke, heart diseases, irritable bowel disorder, inflammation and cataract. The present sequence is a probe designed to anneal to the apz manh and function in the bDNA manh abade with system. This probe used in the apz assay for antagonist which is used in the exemplification of the

```
The invention provides methods of treating a subject suffering from a condition associated with peroxisome proliferator activated receptor gamma (PpAggamma) activity that involves administering a benzoxazinone compound of a specified formula to the subject. The method is useful for treating and inhibiting in a subject the onset of a condition associated with PpAggamma activity such as a condition of reduced insulin sensitivity, non-insulin dependant diabetes mellitus, obesity, nephropathy, retinopathy, atherosclerosis, polycystic ovary gyndrom, hypertension, ischemia, stroke, heart diseases, irritable bowel disorder, inflammation and cataract. Sequences Aal68004-023 represent oligonucleotide probes specific for ap2 used in ap2 mRNA assay for

The patent discloses 4h-Benzo(1,4) oxazin-3-one compounds which are useful as peroxisome proliferator activated receptor (PPAR) gamma agonists and antagonists. The invention also relates to compositions comprising such compounds and methods for treating or inhibiting the onset of a disorder in glucose and lipid metabolism, preferably a condition of reduced insulin sensitivity, such as non-insulin dependent diabetes mellitus (NIDDM), obesity, atherosclerosis, nephropathy, neuropathy, retinopathy, polycystic ovary syndrome, hypertenaion, ischaemia, stroke, heart diseases, irritable bowel disorder, inflammation and cataract. The present DNA sequence is a probe which is designed to anneal to ap2 mRNA and function in the bDNA mRNA detection system. This probe is used in ap2 assay for antagonist in the exemplification of the invention 0; Gaps Use of 4h-benzo(1,4)oxazin-3-one derivatives for treating a subject suffering from a disorder in glucose and lipid metabolism e.g. non-insulin dependant diabetes mellitus and obesity. ```
This invention relates to a novel apparatus for monitoring biological interaction which comprises a substrate and a modified aptamer attached contented with the substrate, where a target molecule or its portion, contacted with the modified aptamer under conditions to allow formation of a complex between the modified aptamer and the target molecule or its portion, is detected. The invention may be useful in developing phosphorotrhioare agonists or antagonists which may have antibacterial, immunosuppressive, antirheumatic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, antiarthritic, and apparatus of the present invention are useful for monitoring hological interactions and in functional proteomics. As an example, and apparatus of the present invention are useful for monitoring biological interactions and in functional proteomics. As an example, and apparatus of the present invention are useful for monitoring biological interactions and in functional proteomics. As an example, and apparatus of the present related diseases, such as toxic shock, sepsis, rectains NF-kappas aptamer-related diseases, such as toxic shock, sepsis, remainated athirtis, Crohn's disease, generalised inflammatory bowel disease, abbestos lung diseases, Hodgkin's disease, prostate cancer, cell lymphoma, lymphoid malignancies, HTM-1 induced adult T-cell leukaemia, atherosclerosis, cytomegalovirus, herpes simplex virus, JCV, SV-40, rhinovirus, influenza, neurological disorders and lymphomas. The present sequence is that of an oligomucleotide duplex which was used during the exemplification of the invention.
                                                                                                                                                                                                                                                      New apparatus with a substrate and a modified nucleotide aptamer for monitoring biological interactions, useful for diagnosing and treating NF-kB aptamer-related diseases, such as toxic shock, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                            Claim 58; SEQ ID NO 94; 67pp; English.
                                                                                                                                                                                                                                                                                                                                                       cancer and AIDS.

```
nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase (also known as PEPCK-mitochondrial phosphoenolpyruvate carboxykinase (also known as PEPCK-mitochondrial) phosphoenolpyruvate mitpEPCK), where the Oligonucleotide specifically hybridise with and inhibit the expression of human mtPEPCK. The antisense oligonucleotides can be used for inhibiting the expression of mtPEPCK in human cells or particularly a human suspected of having or treating an animal, particularly a human suspected of having or being prone to a condition or disease associated with expression of mtPEPCK. They can also be used in diagnostics and as research reagents in sandwich and other assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase useful for treating a human with a mitochondrial phosphoenolpyruvate carboxykinase-associated
amplify the ilvC gene, panE gene, panB gene, panC gene, panD gene and the avtA gene which are used in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method for the production, and improvement, of panthothenic acid (1)-producing microorganisms by amplifying (particularly overexpressing) sequences (1) that encode ketopanthoate reductase (XPR), specifically the pans gene, either individually or together. Optionally the ilvC gene is also amplified. (1) is a vitamin used in cosmetics, medicine and human or animal nutrition. The method provides increased yields of (1), e.g. 35-40 mug/ml for the most productive strains. AAA12160-A12171 represent PCR primers used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful as

                                                                                                                                                                                                  This sequence represents an antisense inhibitor of the invention, and inhibits the expression of the human G-alpha-13 protein. The antisense compounds of the invention are of 8 to 30 nucleobases in length, that inhibits the expression of the human G-alpha-13. The antisense compound is useful for treating an animal, particularly humans, having or being prone to a disease or condition associated with the expression of G-alpha-13, such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer; panthothenic acid; ketopanthoate reductase; panB gene; vitamin; cosmetic; medicine; nutrition; ilvC gene; panB gene; panC gene; panD gene; avtA gene; ss.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an infilammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine reducing surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel DNA vaccine for flatfish rhabdovirus (HIRRV) infected fishes, which provides immunity against HIRRV. The vaccination method uses a DNA construct comprising a transcriptional-control sequence containing cytemegalovirus immediate-type promoter, operably coupled to a nucleotide sequence encoding an immunogenic polyapeptide of HIRRV. The DNA vaccine has vircide activity. The HIRRV DNA vaccine is useful for administering to a fish belonging to the flatfish family by gene gun. The HIRRV DNA vaccine is useful for inducing preventing HIRRV infected by HIRRV and is also useful for preventing HIRRV infection in flatfish. The HIRRV DNA vaccine is effective in enhancing immunity of fish infected by HIRRV. This effective in enhancing immunity of fish infected by HIRRV This infected by Appreciation is equence represents an oligo used in the analysis of the mRNA expression level from the muscles of flatfish, following an innoculation with the flatfish rhabdovirus vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA vaccine for flatfish rhabdovirus infected fishes has DNA construct comprising a transcriptional control sequence coupled to a nucleotide sequence encoding an immunogenic protein of flatfish rhabdovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

AAT51423-T51435 represent amplification primers used in the construction of an E. coli hygromycin B phosphotransferase (hpt) gene containing vector of the invention. The vector these sequences were used to construct also contained a luciferase gene. The hpt gene used in the vector, is used as a dominant selectable marker. The hpt gene has preferably been modified, to provide increased resistance to hygromycin in comparison to the wild type gene. In the vector, the hpt gene has the control of a promoter (such as the OpP-2 promoter) that is native to gazicus bisporus. The vector can then be used in the production of a starker, and domor marker using this vector; the selection marker, and domor maker integrated into the homobasidomycetes, and expressed at a level which allows direct selection, and stable maintenance of the transformed cells. Previously, the domor DNA was not both integrated and expressed at high enough levels for direct selection and stable maintenance to be possible. The transformed homobasidiomycetes can then be used for the commercial production of substances, such as
                                                                                                                                                                                                                                                                                         Production of stably transformed homo-basidiomycetes - with altered genetic characteristics for e.g. commercial production of enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 21 BP; 6 A; 7 C; 4 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the Thermus sp. AK16D DNA ligase enzyme. This thermostable ligase has 100 fold higher fidelity than T4 ligase and 6 fold higher fidelity than Thermus thermophilus ligase. The present sequence is the degenerate antisense primer #3 corresponding to amino acids 641-647 of the T.thermophilus HB8 DNA ligase gene. This primer was used to amplify DNA ligase gene fragments from various Thermus sprains. The high specificity and thermostability of Thermus sp. Ak16D ligase makes it useful for use in ligase based linear signal amplification, known as LDR/PCR. Ligation of suitable oligomucleotide probes can be disrupted by hybridisation mismatches. This feature may be used to detect infectious diseases (for example bacterial, fungal or viral infection),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymerase chain reaction, PCR; primer; amplify; E. coli; GDP-2 promoter; Agaricus bisporus; hygromycin B phosphotransferase; hpt gene; luciferase; homobasidiomycetes; metabolite; enzyme production; ss.

This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viablity, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a conscioun, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene comman somatic cells, and the first gene. The producte and methods can be consent in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cancers, benigh tumours, endometriods. Polyvestic kindry disease, and cancers where host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent con man polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Respiratory syncytial virus; RSV; viral vector; mutated RSV gene; HBV; RSV antigenome; functional deletion; M2 gene; RSV-A; RSV-B; antigen; L gene mutation; vaccine; bivalent vaccine; influenza; HIV-1; HIV-2; SS.
                   Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

                                                                                                                                                                                                                                                                         This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viablity, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene specific inhibitor for the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene comment of colls of the green in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic concers, benigh tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AZZSSB12-ZZSB25 represent thuman polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                            Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The specification describes recombinant respiratory syncytial virus (RSV) particles and viral vectors which express heterologous genes or mutated RSV genes. The RSV particles comprise a RSV antigenome or genome containing at least one functional deletion in an M2 gene, or encode antigenic polypeptides of both RSV-A and RSV-B, or contain a L gene mutation. The recombinant RSV particles can be used to produce vaccines, e.g. bivalent vaccine against RSV-A and RSV-B, or RSV and influenza. Recombinant RSV vaccines can also be constructed for viruses such as HIV-1, HIV-2 and HBV, by constructing a RSV comprising a heterologous sequence from these organisms. The present oligonucleotide was used to construct the ribozyme/T7 terminator sequence, which was construct vectors which are used in the course of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a PCR primer for the coding sequence for enoylacrate (Tabl) from Neissaria gonorrheae. The protein was used to create a number of mutants which can be used to determine the targets of antibacterial compounds and understand how the target and compound interacts. This in turn is useful for identifying other antibacterial agents. The Fabl sequence is particularly useful for generating thy dinylocoxydiphenylether (DHDPE) resistant strains of N. gonorrheae, Staphylocoxous surens, Streptococcus progrems, Pacinical Actinobacter, E. coli, Staphylococcus aurens, Streptococcus progrems, Pseudomonas aeruginosa, Enterococcus faecium, Bacillus subtilis and Halloobacter pylori, which can then be used to determine how to fight infection by these bacteria. This primer was used to create random mutations in the Fabl coding sequence. (Updated on 15-SEP-2003 to
                                                                                                                                                                                                                                                                                                                                                          Fabl; encyl-ACP reductase; DHDPE resistance; infection; PCR primer; ss.

The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholaminerlated diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             X2X5X5X5X5X5X5X5X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides a novel in vitro method for the detection of microorganisms and viruses. The method comprises: (1) forming a comprises chair reaction (FCR) mixture by combining a predetermined volume of a sample to be tested for the presence of a nucleic acid sequence comprising 5'-TAGAAGC-3', known amounts of a first primer comprising 5'-GCTAAGCTCCCAAAGCT-3', and a second primer comprising 5'-CAGAGCTCCTAACA-3', and PCR reagents; (2) forming a PCR product by cycling the PCR mixture to amplify the nucleic acid sequence, if present, comprising 5'-GGTGGCTCTCTAAGCGCC-3' to replicate and attain 0.25-10000mug nuclectide product kmul mixture; (3) adding a probe containing DNA comprising 5'-GGTGGCTCTTAAGCCAC-3' to the PCR mixture or to the PCR product to cause the DNA to hybridize with concern and expense of sequence, if present, and change the conformation of the probe; and (4) determining whether or not bacteria are present in the sample by detecting the conformational change of the probe, a conformational change indicating the presence of bacteria in the sample. CT the methods can be used for the detection of viruses and microorganisms, including bacteria, yeast, molds and protister. They can be used in the food and cosmetic industry and in clinical diagnostics. Using the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection of microorganisms and viruses, for use in the food and cosmetic industries and for clinical diagnostics.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various bolymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification Gaps ö ch 3.4%; Score 14.6; DB 1; Length 21; 1 Similarity 81.0%; Pred. Infectious respiratory syncytial virus particle, useful for producing vaccines, comprises a viral genome or antigenome with a deletion in an

Disclosure; Page 34; 128pp; English.

terminator sequence, which was then ligated to the ends of the CDNA respiratory syncytial virus (RSV). The specification describes an infectious RSV particle comprising an RSV (anti) spenome that has at least one functional deletion in a virus accessory gene. Especially, the genome contains the reverse complement of a mRNA-encoding sequence linked to a polymerase-binding site (BBS) of an RSV. The RSV particles of the invention are useful for preparing attenuated, live vaccines, including those that express heterologous gene products (particularly from another strain of RSV, some other virus or pathogen, cellular protein or tumour strain of RSV, some opter virus or pathogen, cellular protein or tumour strain of RSV, some products (e.g. viral proteins or ribozymes for prevention or treatment of disease) in cells and/or to rescue heterologous genes in virus particles Oligonucleotides AAF25449-59 were used to construct a ribozyme/T7

Isolated infectious respiratory syncytial virus particle, useful as a vaccine, has an attenuated phenotype comprising the viral genome that has a heterologous sequence encoding a G and F protein and a mutation in the a heterolo M2-2 gene.

Example 6; Page 39; 150pp; English.

The invention describes an isolated infectious respiratory syncytial virus (RSV) particle with an attenuated phenotype comprising an RSV antigenome or genome, where the genome or antigenome has a heterologous sequence encoding a G and F protein, and a mutation in the M2-2 gene. The SKV particle is useful as expression vector or vaccine. This sequence represents an oligonuclectide used in the construction of leader and trailer sequences for creation and functional analysis of reporter

Also included are detecting oligodendroglia and their precursor cells capable of forming myelin (using as an indicator the expression of For receptor gamma chain in the precursor cells), investigation of the expression of For ecceptor gamma chain in animal brain tissue (by immune typing, cytochemical amalysis, gene amplification or Western blotting) and kits for these methods, containing anit-For receptor gamma chain antibody or amplification primers. The drug is used for treatment and prevention of neurodegenerative diseases, and disorders of myelin formation, such as multiple solerosis, Krabbe's diseases, adrenolewicodystrophy and metachromic leukodystrophy. The present sequence is an For receptor Ill alpha gamma chain PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR; primer; ss; Fc receptor gamma chain; neuroprotective; oligodendroglia; myelin; neurodegenerative disease; multiple sclerosis; myelin formation disorder; Krabbe's a disease; adrenoleukodystrophy; metachromic leukodystrophy; Fc receptor III alpha gamma chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises a non-human animal model for demyelinating disease - in which myelinogenesis is inhibited by a defect of myelinogenesis signal molecules in oligodendroglia. The non-human animal model of the invention is useful for screening for a myelin growth regulator, or for screening for a therapeutic agent which is useful for treating a demyelinating disease such as multiple sclerosis. The present DNA sequence represents a PCR primer that was used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Multipotent adult stem cell; MASC; cell replacement therapy; cytostatic; cardiant; cardiovascular; hepatotropic; haemostatic; antidiabetic; virucide; antinflammatory; vasotropic; antianaemic; neuroprotective;

Retrovirus LTR PCR primer.

```
The present sequence is a primer for a retrovirus long terminal repeat (LTR). The primer was used in an example from the invention in which a retroviral marking study was used to demonstrate that neurons, astrocytes and oligodendrocytes can produced from a single bone marrow-derived multipotent adult stem (MASC), which also differentiated into muscle and differentiating the invention relates to methods of obtaining, maintaining and differentiating MASC. The MASC are derived from a non-embryonic organ or tissue, such as bone marrow, muscle, brain, umbilical cord blood or placenta, and have the capacity to be induced to differentiate to a cell type of mesodermal, ectodermal or endodermal origin, including of mesole, smooth muscle, cardiac muscle, fibroblast, marrow stroma, skeletal muscle, smooth muscle, cardiac muscle, endothelial, pither, categories, handled the constitutively express oct4 and high levels of telomerase and are negative for CD44, MHC class I and MHC class II expression. Teratomas are not formed when MASC are administered to a patient. MASC or their progeny are particularly useful for treating cancer, cardiacyascular disease, conficiency, connective tissue disorders, autoimmune disease, desenerative or traumatic neurological conditions, autoimmune disease, desenerative or traumatic neurological conditions, autoimmune disease, be directed to abdominal aortic aneurysm, cardiac bypass surgery, peripheral vascular disease, or coronary vascular disease (all claimed). (Updated on 07-AUG-2003 to correct OS field) (Updated on 29-AUG-2003 to correct OS field) (Updated on 29-AUG-2003 to

```

New multipotent adult stem cells that can be induced to differentiate to form a cell type of mesodermal, ectodermal or endodermal origin, useful for treating e.g. cancer, diabetes, hepatitis, hemophilia, ischemia or inflammation.

WPI; 2002-667000/71.

Example 10; Page 55; 117pp; English.

The present sequence is a primer for a retrovirus long terminal repeat (ITR). The primer was used in an example from the invention in which a retroviral marking study was used to demonstrate that neurons, astrocytes and oligodendrocytes can produced from a single bone marrow-derived multipotent adult stem (MASC), which also differentiated into muscle and differentiating masc. The MASC are derived from a non-embryonic organ or tissue, such as bone marrow, muscle, brain, umbilical cord blood or placenta, and have the capacity to be induced to differentiate to a cell type of mesodermal, ectodermal or endockmal origin, including corteoblast, chondrocyte, adipocyte, fibroblast, marrow stroma, skeletal corteoblast, chondrocyte, adipocyte, fibroblast, marrow stroma, skeletal muscle, smooth muscle, cardiac muscle, endothelial, pither, corteoblast, chondrocyte cell types.

CC panoreas, haematopoletic, gilal, neuronal or oligodendrocyte cell types. CC mestabolic disease oct4 and high levels of telomerase and are not formed when MASC are administered to a patient. MASC or their progeny are particularly useful for trreating cancer, cardiovascular disease, cort canneation entrological conditions, autoimmune disease, disease, transplant rejection, ischaemia or inflammation. Treatment may be directed to abdominal aortic aneurysm, cardiac bypass surgery, peripheral vascular disease, or coronary vascular disease (all claimed). (Updated on 07-MUG-2003 to correct OS field.) (Updated on 29-AUG-2003 to correct OS field.) (Updated on 29-AUG-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention is concerned with a number of human single mucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to disganose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in diesase diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

                                                                                                                                                            The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ceptablamlological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, actinic pass or be used to treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and side in the second or and seed or the sequences used in the
                                                                                                                                                                                         Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MWP; matrix metalloproteinase; growth factor; reductase; scarting; cytostatic; antipsoriatic; dermatclogical; antiesborrheic; antidiabetic; virucide; antipsickling; ophthalmological; keratolytic; gene therapy; viral wart; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                 Cell-cycle dependent kinase cdk8 ribozyme binding site SEQ ID NO:956.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 4 A; 3 C; 9 G; 3 T; 0 U; 0 Other;

```

Assessing susceptibility to syndromes including migraine with aura, depression and anxiety - by detecting variant alleles in genes for dopaminergic receptors or transporter, also treatment using agents that antagonise binding of dopamine to these proteins.

```
The present sequence is a primer for the dopaminergic gene DRD5, which can be used in a novel method assess susceptibility to a syndrome having symptoms of migraine with aura (MMA), depression and/or anxiety. The method comprises detecting a variant allele of at least 1 dopaminergic gene. Analysis of variant dopaminergic gene alleles may also differentiate between patients with MMA, and those with migraine without aura (MO) or other conditions, e.g. stroke, that produce similar symptoms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse C/EBP beta phosphorothioate antisense oligonucleotide, SEQ ID:127.

Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/BBP alpha) and which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/BBP alpha RNA, and were analysed for their effect on C/BBP alpha mENA levels alpha RNA, and were analysed for their effect on C/BBP alpha mENA levels by quantitative real-time PCR. The C/BBP family of proteins are a family of transcription factors which regulate the expression of a wide range of commercial insue development, cellular function, cellular control normal lissue development, cellular function, cellular correspondents of proliferation and functional differentiation. C/BBP beta (also known as C/BPBP, LAP, TCF5, CRP2, NRILG, ILGBP, NP, AGP/BBP and Apc/BBP) compared to primarily regulates hormone responsiveness and oxidative stress responses compared to be involved in carbohydrate metabolism, immunity, the Thi cresponse, female fertility and gluconeogenic pathways. C/BBP beta is thought to be involved in carbohydrate metabolism, immunity, the Thi cresponse, female fertility and gluconeogenic pathways. C/BBP beta is capressed in the liver, lung, spleen, kidney, brain, and testils, with the highest expression found in the lung. It is also expressed at a higher compared level is of glucose, indicating that it is involved in the level sof glucose, indicating that it is involved in the celevated levels of glucose, indicating that it is involved in the conditions associated with C/BBP beta expression, gunt as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly veryian cancer), infection, or inflammation Claim 1; Col 47-48; 69pp; English

proliferation and functional differentiation. C/EBP beta (also known as C/EBP) LAP, TCFS, (REP2, NETL6, IL6DBP, NR-M, AGP/EBP) and App/EBP)

primarily regulates hormone responsiveness and oxidative stress responses and is a mediator of IL-6 (interlukin-6) signalling. C/EBP beta is thought to be involved in carbohydrate metabolism, immunity, the Thi response, female fertility and gluconeoganic pathways. C/EBP beta is expressed in the liver, lung, spleen, kidney, brain, and testis, with the lighest expression found in the lung. It is also expressed at a higher level in malignant ovarian tissue compared with normal ovarian tissue, and its expression in pancreas is upregulated in response to chronically and its expression in pancreas is upregulated in response to chronically impairment of insulin secretion in type II diabetes. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of confittions associated with C/EBP beta expression, such as cancer confittions associated with C/EBP beta expression, such as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly type II diabetes), infection, or inflammation

- can be useful Synthetic beta-galactosidase inactive in milk but active in vivo chemically activated and used to treat lactose intolexance, also in cheese production.

Example 1; Page 13; 38pp; English.

Primers 1 and 2 (AAV32913) were used in a PCR reaction to amplify the bovine lactoferrin cDNA. The PCR product was used as a tail which was fused through a pepsin recognition site to the 3' end of the Aspergillus niger beta-galactosidase gene. The invention provides a synthetic beta-galactosidase which differs from the natural occurring enzyme in being inactive in milk but capable of being activated by a chemical or condition naturally present in the gasrointestinal tract of humans. The design of this synthetic enzyme comprises of a tail domain fused to the

```
ó
beta-galactosidase through a cleavage site. The presence of the tail domain renders the enzyme inactive and it can also be used as a purification handle. The synthetic beta-galactosidase is claimed to be able to hydrolyse lactose in vivo to overcome lactase intolerance and thereby reduce associated gastrointestinal disorders. The synthetic betaglactosidase is also claimed to be useful in cheese making whereby it is activated by chymosin when added to milk
                                                                                                                                                                                                                                                                                                                                                Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and WPI; 2001-226749/23

Example; Page 48; 242pp; English.

atherosclerosis.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various obly morphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various bolymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, cornary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

They include alpha-lactoalbumin gene full length sequence, alpha-lactoalbumin gene 5' lateral wing acquence, beta-lactoglobulin gene 5' lateral wing and 3' terminal sequence, alpha Sl-casein gene 5' lateral wing and 3' terminal sequence, alpha Sl-casein gene 5' lateral wing and 3' terminal sequence, beta -casein gene 5' lateral wing and 3' terminal sequence, beta -casein gene 5' alteral wing and 3' terminal acquence, and lactoferritin gene 5' lateral wing sequence. This polymolocide sequence represents an oligo relating to the yak milk protein genes of the invention.

The present sequence is a PCR primer for plasmid pBlue-TH6, which was used in the construction of the expression plasmid pEdHCkappa-TH6. pEdHCkappa-TH6 was prepd. by inserting a gene encoding the light-chain [LC) variable region of human anti-TSH antibody (Ab) into pEdHCkappa, an expression vector for a Ab LC. pEdHCkappa-TH6, an expression vector for the prodn. of an Ab LC in an animal host cell, contains 5'3' a SV40 promoter, and base sequences encoding dihydrofolate reductase, Ab LC signal sequence and Ab LC variable and constant regions. pEdHCkappa-TH6 along with the equivalent heavy chain expression vector pEdHCG1-TH8 can be used for the prepn. of an Ab mol. in an animal host cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Expression vectors for antibody (Ab) heavy and light chains - introduced concurrently into animal host cell to produce Ab mol. which is secreted

```

Crasscripts expressed in Xenomice. The products were used for repertoire transcripts expressed in Xenomice. The products were used for repertoire analysis. The specification describes a transgenic non-thuman mammal which has genome modifications that comprise an inactivated endogenous Ig locus, so that the mammal does not display normal B-cell development. The conditions also has an inserted human heavy chain Ig locus in germline configuration, the human heavy chain Ig locus in micro constant region and regulatory and switch sequences, human J-H genes and an inserted human wappa constant region and regulatory and switch sequences, human J-H genes, and human W-H genes and an inserted human wappa continuing to Ight chain Ig locus in germline configuration, the human kappa light chain Ig locus comprising a human Nappa constant region, J-kappa genes, where the number of V-H and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The cransgenic animals have a near complete human Ig locus, including both a transgenic animals have a near complete human Iglocus, including both a cused for the production of human antibodies when exposed to particular antigens e.g. when exposed to human antibodies when respectively

New transgenic non-human mammals - having an inactivated immunoglobulin locus and a near complete human immunoglobulin locus, used for production

                                                                                                                                                   The primers AAV68617-V68618 were used to produce anti-epidermal growth factor receptor (EGF-r)-antibodies. The antibodies can be administered therapeutically to patients (human or veterinary) to treat solid tumours EGF-r is overexpressed on many human solid tumour types, and the fully human antibodies (i.e. comprising (i) and (ii)) inhibit both epidermal growth factor (EGF) and transforming growth factor alpha (TGF-alpha) binding to EGF-r (Known to lead to cellular proliferation and tumour growth). They can prevent tumour cell growth and, in combination with an antineoplastic agent, may eradicate established tumours. The fully human antibodies can minimise the immunogenic and allergic responses intrinsic to previous mouse/rat or mouse/rat-derived antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sox-9; bone regeneration; cartilage regeneration; campomelic dysplasia; gene therapy; sex reversal; primer; single strand conformation polymorphism; SSCP; PCR; polymerase chain reaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SSCP primers 534 (AAT30310), 661 (AAT30311), 687 (AAT30312), 854 (AAT30313), 836 (AAT30314) and 1018 (AAT30315) were used for SSCP analysis of the SOX-9 gene (see also AAT30309) in campomelic dysplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated SOX-9 genes - used to develop prods. for the promotion or suppression of bone or cartilage differentiation of growth.
                                 Humanised antibodies against epidermal growth factor receptor, EGF-r useful to treat solid tumours whilst inducing reduced immunogenic or allergic effects compared to mouse or mouse-derived antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the human glial cell derived neurotrophic factor (GDNF) and its derivatives and use. The invention also relates to a method of obtaining DNA encoding human glial cell derived neurotrophic factor or its active segments and a method of purifying and fining coarse GDNF. A composition comprising human glial cell derived neurotrophic factor and a medicinal acceptable carrier can be used in the treatment of nervous system diseases. Sequences ACA96807-ACA96889 represent PCR primers used to amplify human GDNF CDNA
                                                                                                                                                               ö
(CD) patients. Primers were designed to amplify the known coding sequence and intron/exon junctions. Unique SSCP conformers were cloned and sequenced. Alterations in SOX-9 can cause both CD and male-to-female sex reversal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human glial cell derived neurotrophic factor and its derivatives and use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

which are complementary to at least a portion of the human osteopontin (OPN) cDNA sequence (AAX29191). The antisense sequences are used to prevent restenosis in tissue, particularly coronary arterial tissue, especially where the patient is undergoing angioplasty, particularly percutaneous trans-luminal coronary angioplasty or directional coronary atherectomy. They prevent secretion of osteopontin by monocytes and macrophages which infiltrate to sites of inflammation following surgery osteopontin probably causes restenosis by inducing coronary artery smooth muscle cells (CASMC) to migrate to, and proliferate at, angioplasty injury sites. Sequences AAX29177-178 represent RT-PCR primers specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAQ73789-Q73822 are partial DNA sequences, one or more of which can be used to encode enzymes having pectin lysae (PL) activity. The Aspergillus sequences by and the coresponding DNA sequence, from which these partial sequences were derived are shown in AAK60881 and AAQ73823 respectively. These PL enzymes degrade plant cell wall components, and can therefore be used to reduce the viscosity of fruit juices. They can also be used for the production of antibodies. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

```
New antisense compound targeted to a nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase useful for treating a human with a mitochondrial phosphoenolpyruvate carboxykinase-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAZ95320 to AAZ95359 represent antisense oligonucleotides targeted to a nucleic acid molecule encoding human mitochondrial phosphoenolpyruvate carboxykinase (also known as PEPCK-mitochondrial, PEPCK-M; PCK2 and mtPEPCK), where the oligonucleotide specifically hybridise with and inhibit the expression of human mtPEPCK. The antisense oligonucleotides can be used for inhibiting the expression of mtPEPCK in human cells or tissues in vitro and can also be used for treating an animal, particularly a human suspected of having or being prone to a condition odisease associated with expression of mtPEPCK. They can also be used in diagnostics and as research reagents in sandwich and other assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 3 A; 7 C; 7 G; 3 T; 0 U; 0 Other;

Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.

Example 12; Page 76; 162pp; English.

The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma,

AAC84282;

New signal transduction nucleic acids and encoded proteins useful for regulating phytohormone expression, including ethylene, auxins, cytokinins and gibberellin, to provide control of plant response to environmental stresses. Zea mays; maize; signal transduction protein; phytohormone; ethylene; auxin; cytokinin; gibberellin; immunogen; PCR primer; ss. Signal transduction cDNA amplifying primer. (PION-) PIONEER HI-BRED INT INC. 99US-0134292P. 99US-0142996P. 28-APR-2000; 2000WO-US011687. WPI; 2001-031929/04. WO200070059-A2. Helentjaris TG; 14-MAY-1999; 08-JUL-1999; 23-NOV-2000. Zea mays. 

The invention provides Zea mays signal transduction proteins and encoding nucleotide sequences. The nucleic acids are useful for regulating explanating captences. The nucleic acids are useful for regulating captences. The mack awxins, cytokinins, and gibberslin, to effect developmental changes in plants and provide control of plant response to environmental stresses. They may also be used as probes or amplification primers in the detection, quantitation or isolation of gene transcripts, for detecting mutations in the gene, for monitoring upregulation of expression or changes in enzyme activity in cremening assays of compounds, for detection of any number of allelic variants, or for site-directed mutagenesis in eukaryotic cells. They may further be used for recombinant expression of their encoded polypeptides, as immunogens in the preparation or screening of antibodies, and in sense or antisense suppression of genes in a host cell, tissue or plant. The proteins may be used in assays for enzyme agonists or antisquists, as immunogens or antigens to obtain antibodies specifically immunoreactive with the proteins. The present sequence represents a PCR primer used for amplifying the cDNA encoding a signal transduction protein

                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense compounds, compositions and methods for modulating the expression of hepsin. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding hepsin. The antisense compound is useful for inhibiting the expression of hepsin in human cells or tissues. It is also useful for treating an animal having a disease or condition associated with hepsin, by inhibiting expression of hepsin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an entisense oligonuclectide targetted to human hepsin DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                      Novel antisense compound targeted to nucleic acids encoding human hepsin, useful for inhibiting the expression of hepsin in human cells or tissues, and for treating humans having a disease associated with human hepsin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; antisense; hepsin; inflammation; tumour; gene therapy; cytostatic; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to an antisense compound 8-30 nucleobases in length targetted to a nucleic acid molecule encoding human hepsin. The antisense compound inhibits the expression of human hepsin. The antisense compound or the pharmaceutical composition of useful for treating animals and human having a disease or condition associated with the expression of hepsin, e.g. inflammation or tumour growth. The antisense compounds are useful also for diagnositis, prophylaxis (e.g. to prevent or delay infection, inflammation or tumour formation) or as research reagents and kits. The method is useful for modulating, specifically inhibiting the expression of hepsin which may be used in research, e.g to distinguish between functions of various members of a biological pathway. The invention is used in gene therapy. The present sequence is human hepsin antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides that modulate (particularly inhibit) human hepsin, useful for treating a disease or condition associated with the expression of hepsin, e.g. inflammation or tumor growth.

The invention relates to antisense compounds targetted to a nucleic acid encoding human receptor interacting protein (RIP)2 to inhibit its expression. Antisense compounds are used for treating diseases associated with RIP2 expression. They are also useful in antisense gene therapy. The present sequence is an oligonucleotide targetted to human RIP2 DNA
encoding human receptor interacting protein (RIP)2, for treating diseases associated with RIP2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method (M1) for the diagnosis of dentinogenesis imperfecta type II and/or its accompanying deafness comprising determining the dentin sialophosphoprotein (DSPP) gene, its transcript and/or protein of an individual for comparison of their sequences with the normal equences and judging the individual to have higher risk of suffering from the disease then the normal population. Also described are: (1) treating dentinogenesis imperfecta type III and/or its accompanying deafness by administering a safe and effective dose of normal DSPP and/or DSP protein to patients; (2) drug compositions containing safe doses of DSPP and/or DSP protein; and (3) a regent kit for detecting dentinogenesis imperfecta type II and/or its accompanying deafness containing probes for binding to the mutation site. The DSPP gene and protein sequences have auditory activity. The method (M1), dentin sialophosphoprotein (DSPP) gene and DSP protein are useful for diagnosing and treating imperfecta type II and/or its accompanying deafness. The DSPP gene is located to chromosome 4421. The present sequence represent as PCR primer for the human DSPP gene, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                     Human, dentin sialophosphoprotein precursor; dentin sialophosphoprotein;

                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a target protein fused with a polypeptide having an amino acid sequence containing an epitope of anti-human type II DNA topolsomerase alpha antibody and the DNA encoding it. The sequences can be used in a method for the detection or the determination of a target protein in which the target protein is detected or determined by using the reactivity between the target protein and the above fused protein as the index, and also in a method for the purification of a target protein in which the above fused protein is contacted to anti-human type II DNA topolsomerase alpha antibody carried on a solid carrier. This sequence represents DNA encoding an anti-human type II DNA topolsomerase alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, K-ras, PCR primer, probe, capture probe, mutation detection; ligase detection reaction, LDR, p53; BRCAL; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome, obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forenal; environmental monitoring; food industry; feed industry; 88.

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

Example 5; Fig 29; 300pp; English.

The present invention describes a method (MI) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and harborial and pollowing and parasitius infectious agents of special man pollowing, wituses e.g. T-cell lymphocytotrophis cirus, bepergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, casteria and pollowirus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as I hydroxylase deficiency, Turner Syndrome and obssity defects.

CC detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is stop and infrared microscope the support at the method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligomucleotide probe present coligonucleotide sequences. WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure, SEQ ID NO 13887; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the intiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of unctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubjournone. A composition of the invention has antiinflammatory antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisflammatory steroid in a subject, for reducing levels of adenosine or lung surfactant in a subject, for reducing levels of adenosine conting antisflammation, lung allergies, or a respiratory disease or condition. Ung inflammation, lung allergies, or a respiratory disease or condition. Specification, but was obtained in electronic format directly from WIPO at the wipo.int/published_pot_sequences

```
The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costinulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated DNA molecule encoding cholecystokinin receptor protein - are
                                                                                                                                                                              Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cholecystokinin receptor protein; CCK; gastrointestinal receptor; ss.

                                                                                       Mixed oligos primed amplification of CCK cDNA was performed using 2 groups of degenerate primers based on the AA sequence from AAR38890. The sense gp. of primers was 72 fold degenerate (AAQ47672). The anti- gp. of primers was 80 fold degenerate and consisted of AAQ47673. The atti- gp. of primers was 80 fold degenerate and consisted of AAQ47673 & AAQ47674. The product of the PCR was used to generate nondegenerate primers for subsequent PCR. The remaining 3' coding and UTRS was obefor using amplificn. (RACE) of CDNA and anchored PCR. RACE was performed using AAQ47675 for the first round and a nested primer, AAQ47676, for the second round. Anchored PCR used the gene specific primer AAQ47677 and the sequences was cloned using PCR. The sense primer was AAQ47677 and the sequences was cloned using PCR. The sense primer was AAQ47679 and the antisense primer was AAQ47680. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid segment comprising one of the 10 - 100 bp sequences given in the specification (sequences of a polymorphic site), or the complement of the segment and a method of analysing a nucleic acid comprising determining the base occupying the polymorphic fixe of the polymorphic fixagment sequences are disclosed in the specification. The information obtained from nucleic acid analysis by the method described is useful in diagnosis or monitoring of diseases like cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid segments containing polymorphic sites, or complements and methods of detecting a nucleic acid - for general use including diagnosis and monitoring of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
purified to isolate cholecystokinin receptor clones and produce anti-
cholecystokinin receptor antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ss; polymorphic site; nucleic acid analysis; diagnosis; monitoring; cancer; inflammation; heart disease; CNS disease.

This sequence is an inhibitor of the human AUR2 protein of the invention. The AUR1 and AUR2 proteins can be used to identify specific modulators of, and to generate specific antibodies recognising AUR1 and AUR2. The modulators can be used for treating conditions involving abnormal AUR signal transduction, specifically cancer (of colon, breast, Kidhey, chandrosarcoma and panneratic tumours, particularly of colon (specifically), breast or kidhey). The modulators can also be used for studying their effects in animal models of proliferative disease. Probes, based on the coding sequences are used, diagnosfically, to detect or quantify AUR mRNA, by hybridisation or polymerase chain reaction (PCR). The DNA, optionally mutated, are useful in gene therapy. Ab are used as diagnostic immunoassay reagents for detecting the proteins

The present invention describes human mitogen-activated protein kinase/extracellular response kinase (MAPK/ERK) kinase kinase (MEKK).

specifically designated MEKKI, MEKKZ and MEKKI. The MEKK proteins are used to modulate and regulate signal transduction in cells, as well as for regulation of gene transcription in a cell encoding MEKK, where the call is involved in inflammation, regulation of cellular proliferation and differentiation, regulation of development, regulation of cell death or regulation of the present also used to prepare antibodies. MEKK polymucleorides can be used to produce the protein recombinantly and as a source of probe and primers. The present sequence represents a PCR primer for human MEKK2, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human MEKK polynucleotides and polypeptides, used for regulating signal transduction in cells.
                                                                                                          MEKKI; MEKK2; MEKK3; mitogen-activated protein kinase; MAPK; ERK; extracellular regulated kinase; signal transduction; regulation; MAPK/ERK; MEK; MKK; inflammation; cellular proliferation; differentiation; development; cell death; PCR primer; ss.

```

The invention relates to a method of preparing plasminogen kringle 5

peptide fragments. The method comprises mixing mammalian plasminogen and
elastase in the ratio 1:100-1:300, followed by incubating and isolating
the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
endothelial cell proliferation and migration. The peptides are useful for
treating angiogenic diseases, primary and metastatic solid tumours and
carcinomas of various organs such as breast, genital tract, endocrine
glands, skin, tumours of the brain and eyes and solid tumours arising
creation used for the prophylaxis of various autoimmune diseases (e.g.,
from haematopoietic malignancies such as leukaemias and lymphomas. They
are also used for the prophylaxis of various autoimmune diseases (e.g.,
blood vessel diseases (e.g., haemangiomas, Osler-Webber Syndrome),
creamiated by excessive or abnormal stimulation of Endothelial cells
(e.g., Crohn's disease, atherosclerosis), diseases are also useful as a birth control agent which
inhibits ovulation and establishment of the placenta. Sequences AAA52294AS2304 represent PCR primers used in the construction of Escherichia coll
expression vectors for recombinant expression of various human Example 20; Col 49; 48pp; English plasminogen kringle 5 fragments

Preparation of Kringle five peptide fragment for treating various disorders such as anglogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation

Example 20; Col 49; 48pp; English.

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastic iiio-iiio0, iollowed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various such as breast, gental tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomae. They are also used for the prophylaxis of various autoimmune diseases (e.g., psortasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber Syndrome), cliseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcren). The peptides are also useful as a birth control agent which and establishment of the placents. Sequences AAA52294. A52304 represent PCR primers used in the construction of Escherichia coli expression vectors for recombinant expression of various human fragments plasminogen kringle 5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a cholecystokinin (CCK) receptor protein. The CCK receptor-encoding DNA molecule is useful for expressing and purifying CCK receptor protein to sequenceable-grade homogeneity. The CCK receptor proteins or fragments are useful for obtaining antibodies that can recognize CCK-expressing cells. The transformed eukaryotic cell innes are useful for studying the receptor in an environment similar to its native environment, e.g. in the context of studying the electrophysiology or binding properties of the receptor. The transformed producel large amounts of the receptor for immunological purposes or for studying protein structure, e.g. crystallography
                                                                                                                                                                                                                                                                                                                       New cholecystokinin (CCK) receptor-encoding DNA molecule, useful for
producing and purifying human CCK receptor protein to sequenceable-grade
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; mycoardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various opportments of polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, concary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, variant thrombospondin 1, variant thrombospondin 4, SNP,
polymorphism, vascular disease, coronary artery disease, forensics,

                                                                                                                                                                                                                  The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various bolymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

p450,
                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various opportantly objective within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                           Mccarthy JJ
                                                                                                                                                                                                                  Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma;
cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide
cytostatic; PCR primer; 88.

The present invention describes the use of irinotecan (1) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifediplne oxidase), polypeptide 5 (CYPAAS) polymuclectide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate consequency and effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with mubstrances (nonresponders), as well as the development of treatment with understances (nonresponders), as well as the development of charge resistances due to suboptimal drug dosing can be avoided, ACF62200 to ACF62751 and ABM34912 to ABM36013 represent sequences used in the exemplification of the present invention

Sequence 21 BP; 0 A; 6 C; 9 G; 6 T; 0 U; 0 Other;

New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.

Disclosure; Page 32; 86pp; English.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or panoreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (infedipine oxidase), polypeptide 5 (CYP3A5) polynucleotide (II). (I) and (II) have

Sequence 21 BP; 6 A; 9 C; 6 G; 0 T; 0 U; 0 Other;

```
The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancratic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) allele which comprises a multidrug resistance protein 1 (MRP1) can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                             ö
cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate decivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM35013 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               irinotecan; colorectal cancer; cervical cancer; gastric cancer;

                                                                                                                                                                                                                                                                                                                                                        d
```

```
New isolated DNA molecule encoding a cholecystokinin (CCK) receptor protein, useful for neuroendocrine modulation of the immune system, and for obtaining antibodies that can recognize CCK-expressing cells.
                                                                                                 Rat; ss; PCR; primer; CCK; cholecystokinin receptor; immunomodulator; RACE: rapid amplification of cDNA ends.
                                                                        RACE oligonucleotide #2 used to amplify rat CCK cDNA 3' sequences.
 ACD26205 standard; DNA; 21 BP
